## Data Source

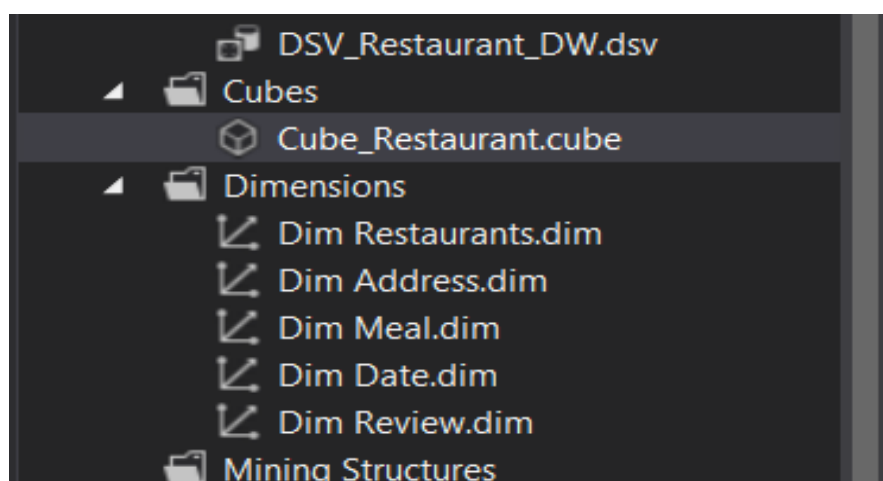

For this purpose use Restaurant\_DataWarehousing as Data warehouse which implemented in last Assignment.

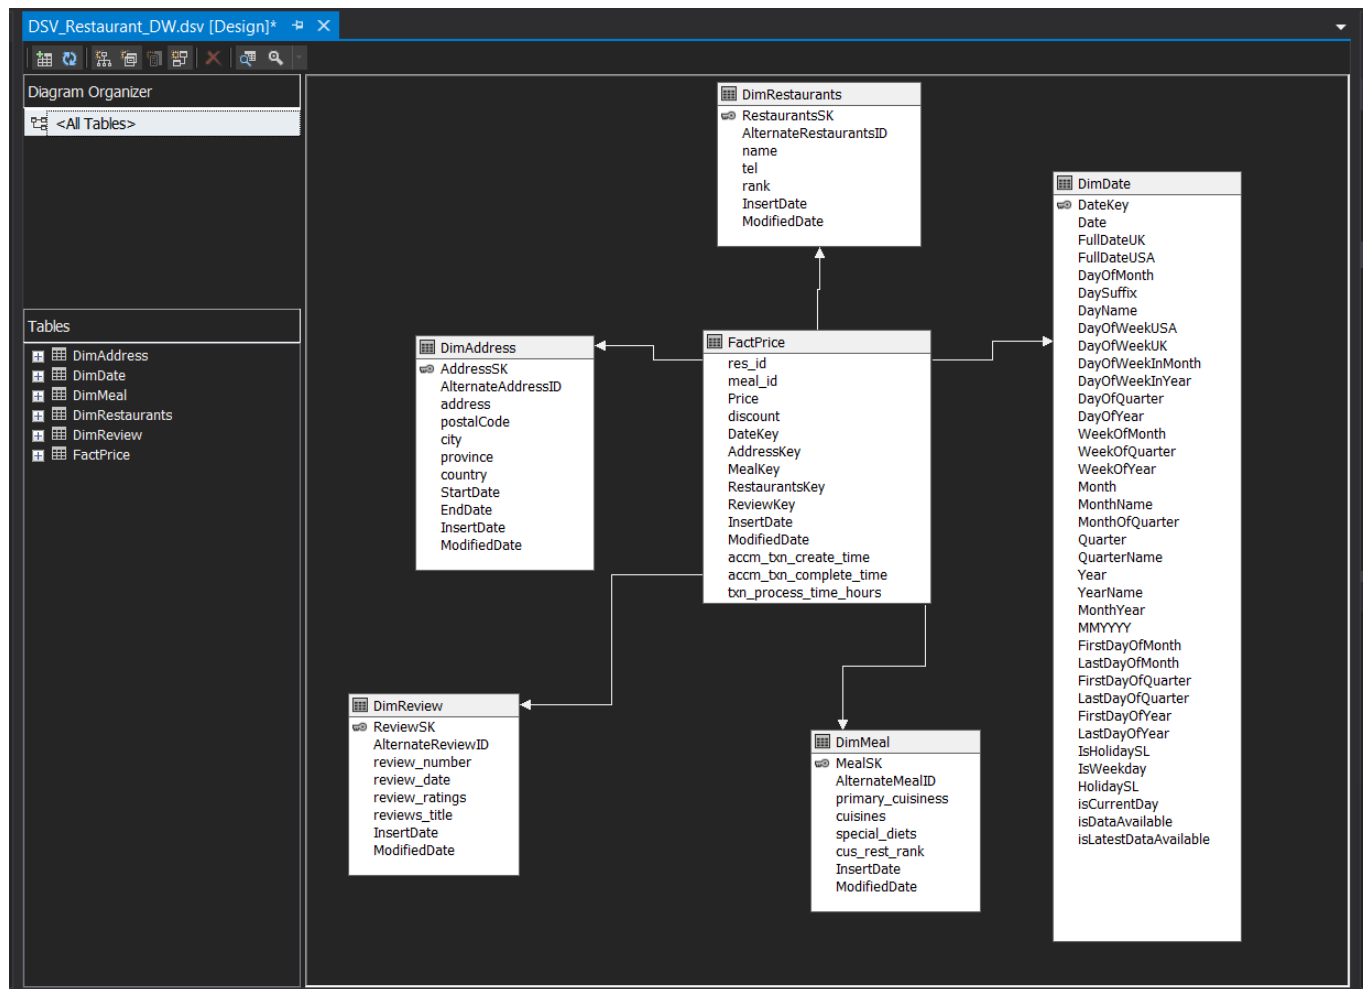

The data set follows a Star Schema and following figure shows the created data source view.

## SSAS Cube

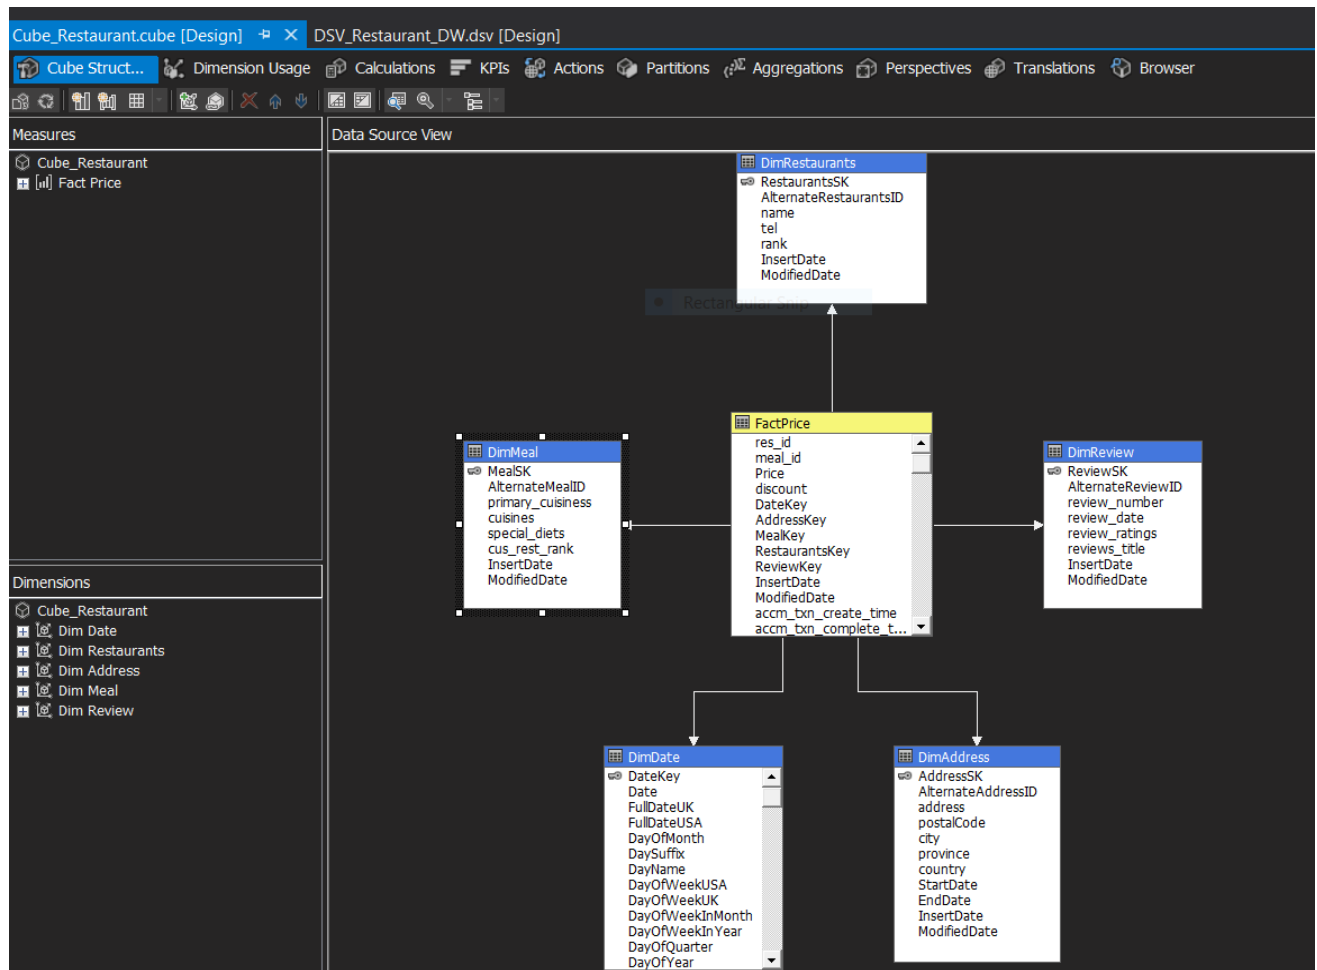

In here first create data source view using previous implemented data dimensions and fact table.

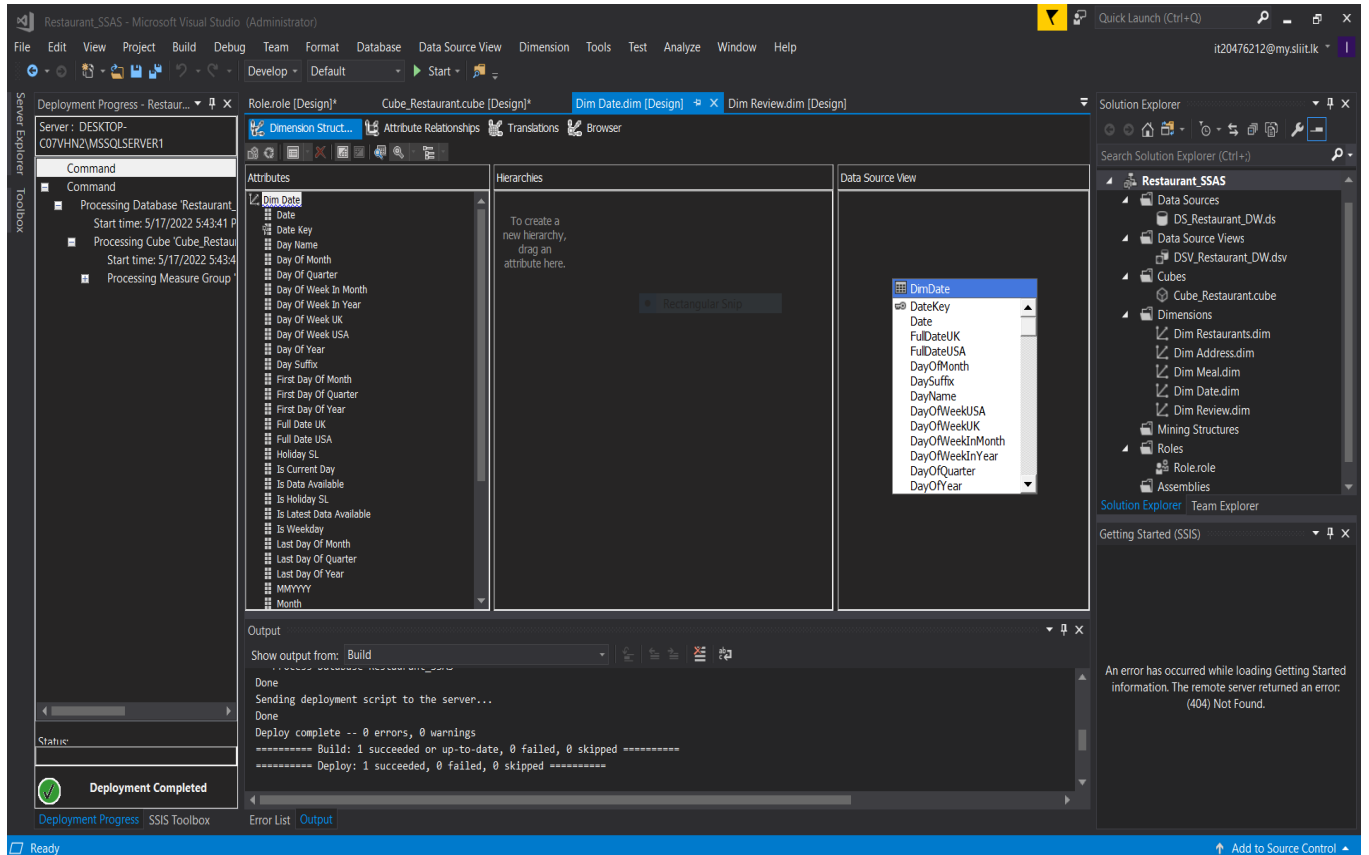

Then create Data Cube,

In here I choose Fact Price as measure group, dimDate, dimRestaurants, dimReview, dimMeal and dimAddress as dimensions.

After that configure all the dimension with proper way.

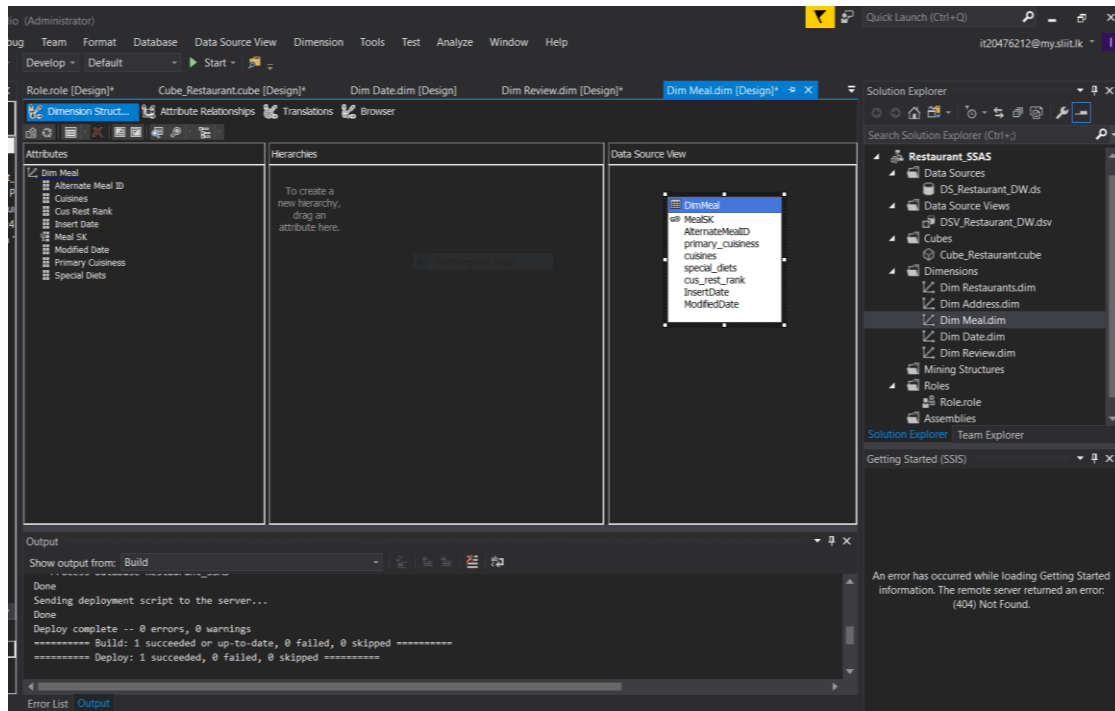

- DimDate

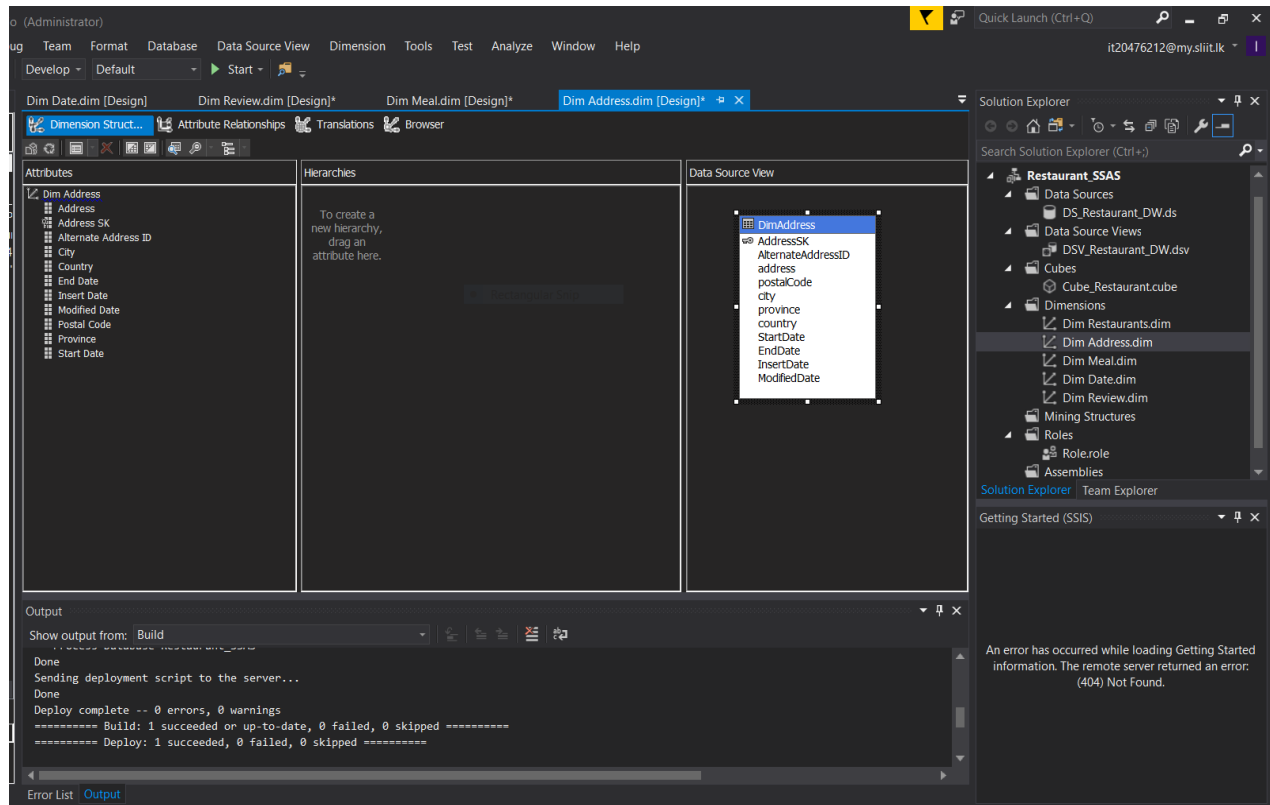

- Dim Restaurants

The screenshot displays the Microsoft Visual Studio environment for developing an SSIS (SQL Server Integration Services) package. The main window shows the 'Dim Restaurants.dim' package in Design View. The 'Attributes' pane on the left lists the fields included in the dimension: Alternate Restaurants ID, Insert Date, Modified Date, Name, Rank, Restaurants SK, and Tel. The 'Data Source View' pane on the right shows a table named 'DimRestaurants' with columns: AlternateRestaurantsID, name, tel, rank, InsertDate, and ModifiedDate. The 'Output' pane at the bottom displays the deployment progress, indicating that the build and deployment were successful. The 'Solution Explorer' on the right shows the project structure for 'Restaurant\_SSAS', including Data Sources, Data Source Views, DSVs, Cubes, Dimensions, Mining Structures, Roles, and Assemblies. A status bar at the bottom indicates 'Deployment Completed'.

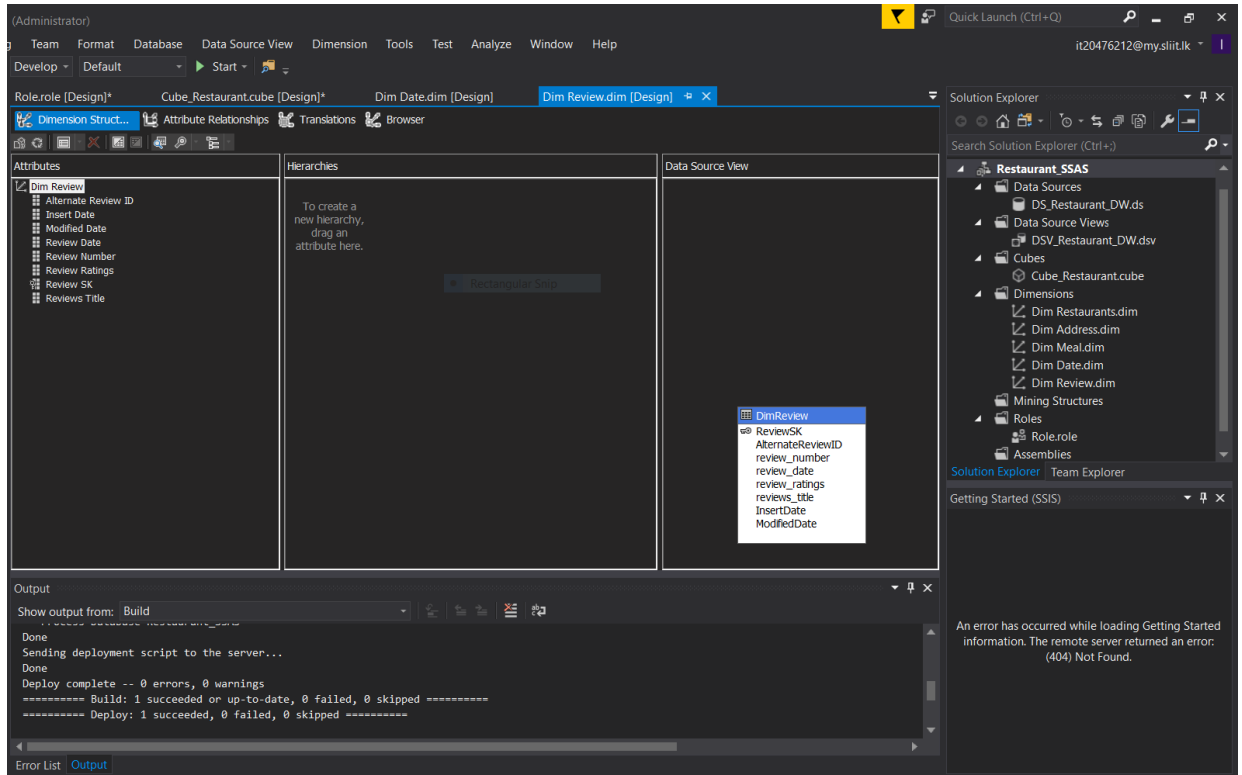

- Dim Meal

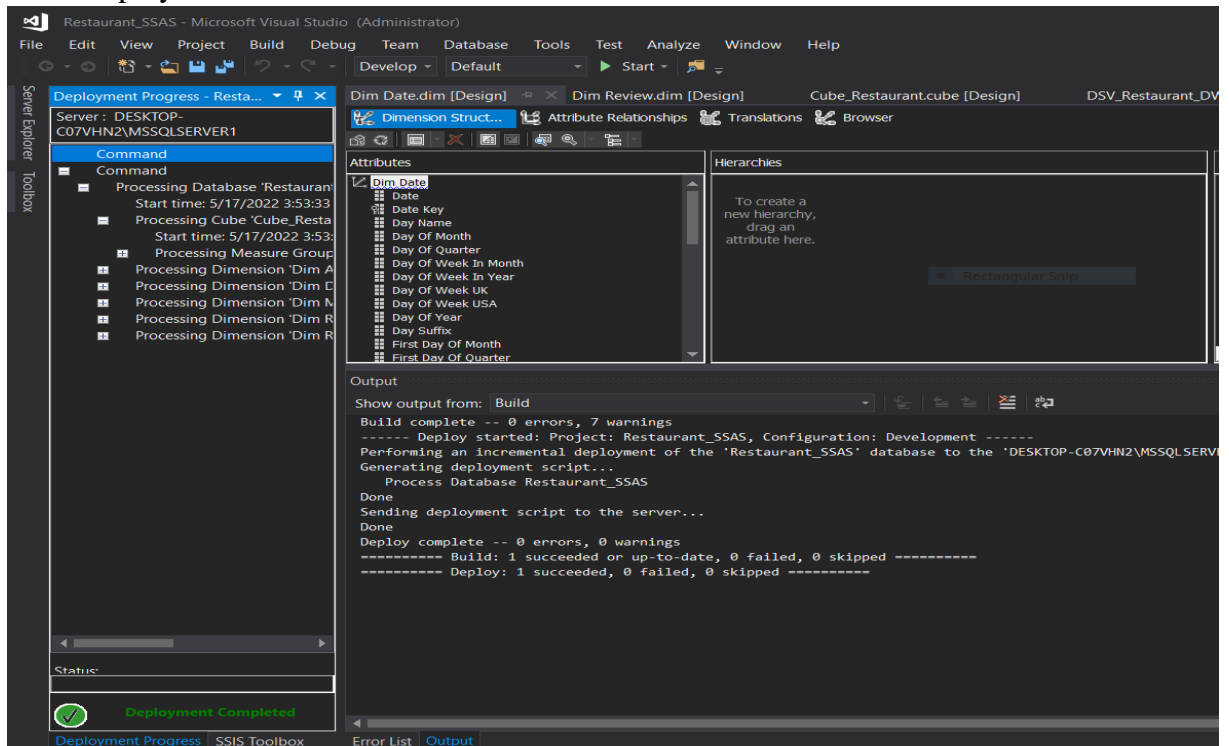

- Dim Address

- Dim Review

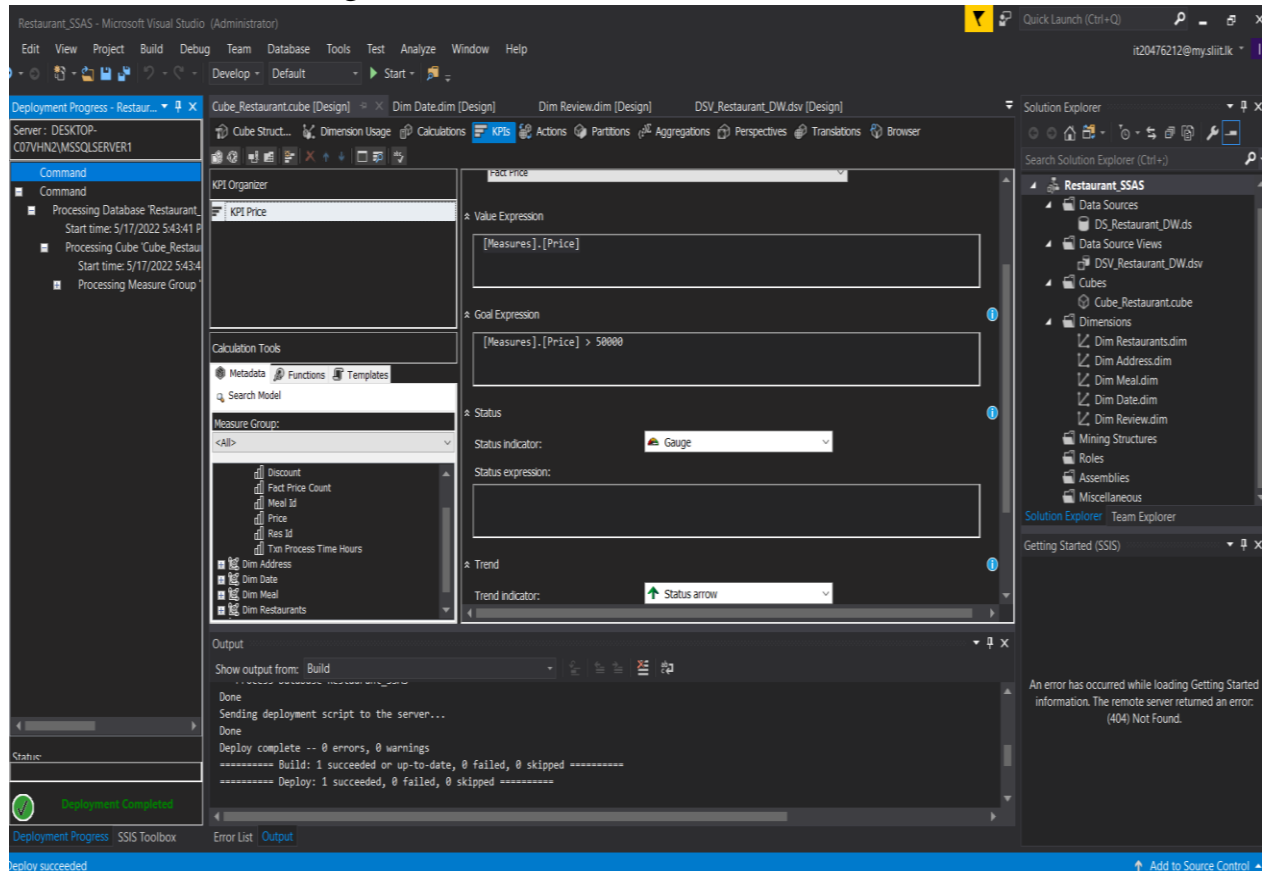

Then Deploy the Cube.

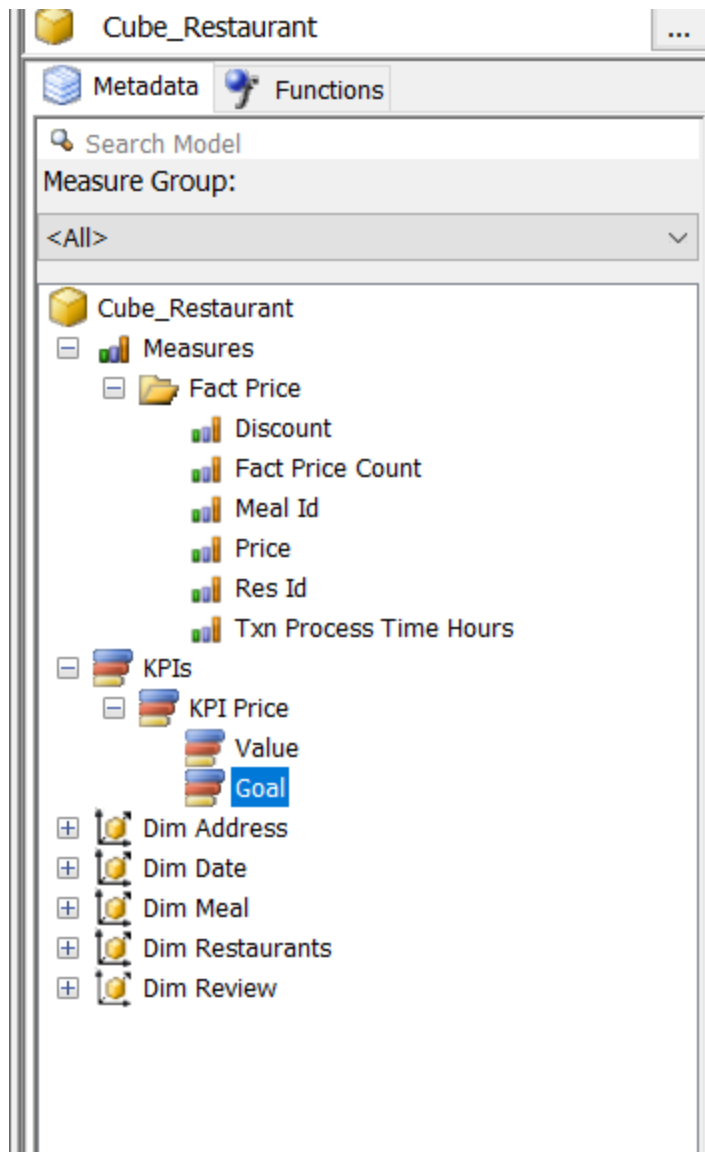

# Create KPI

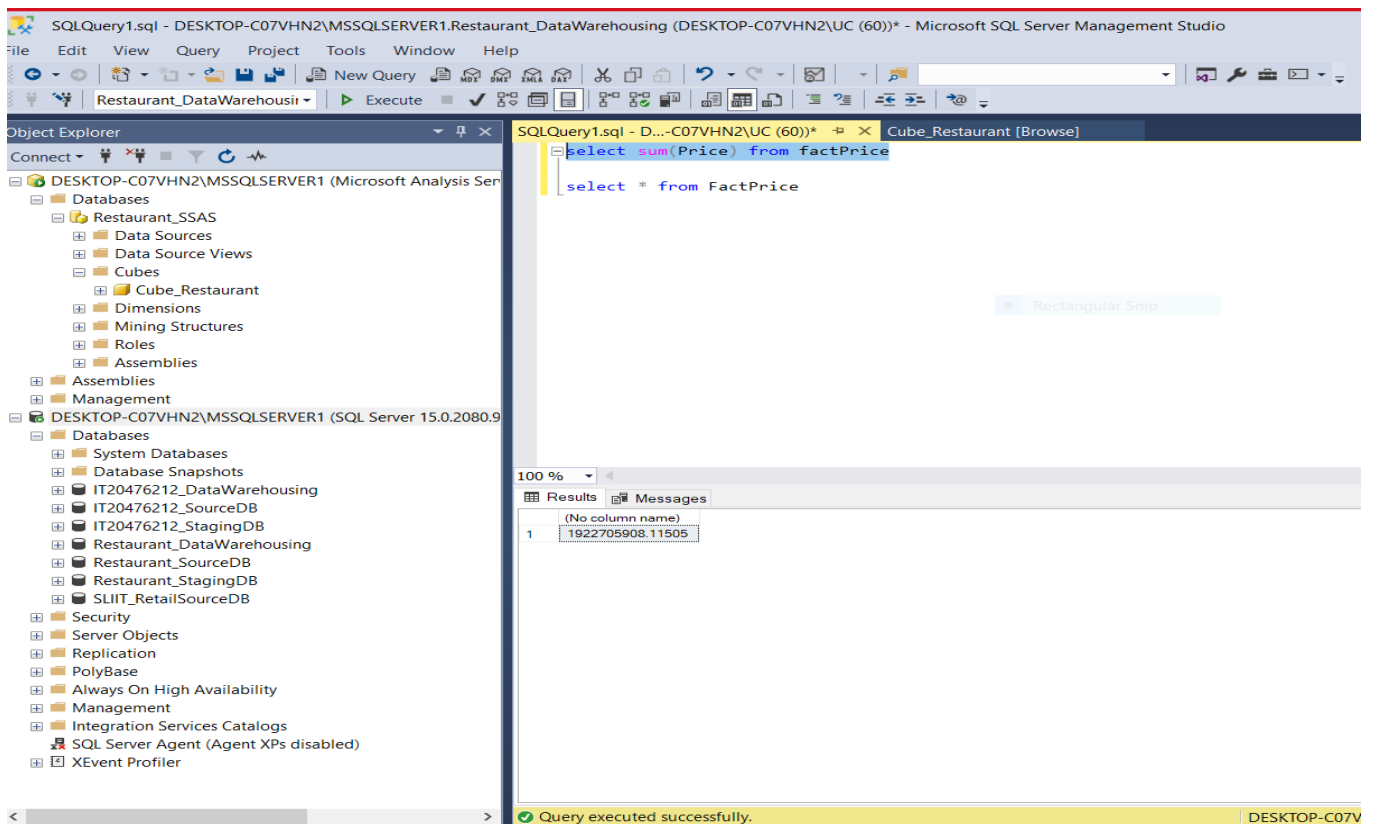

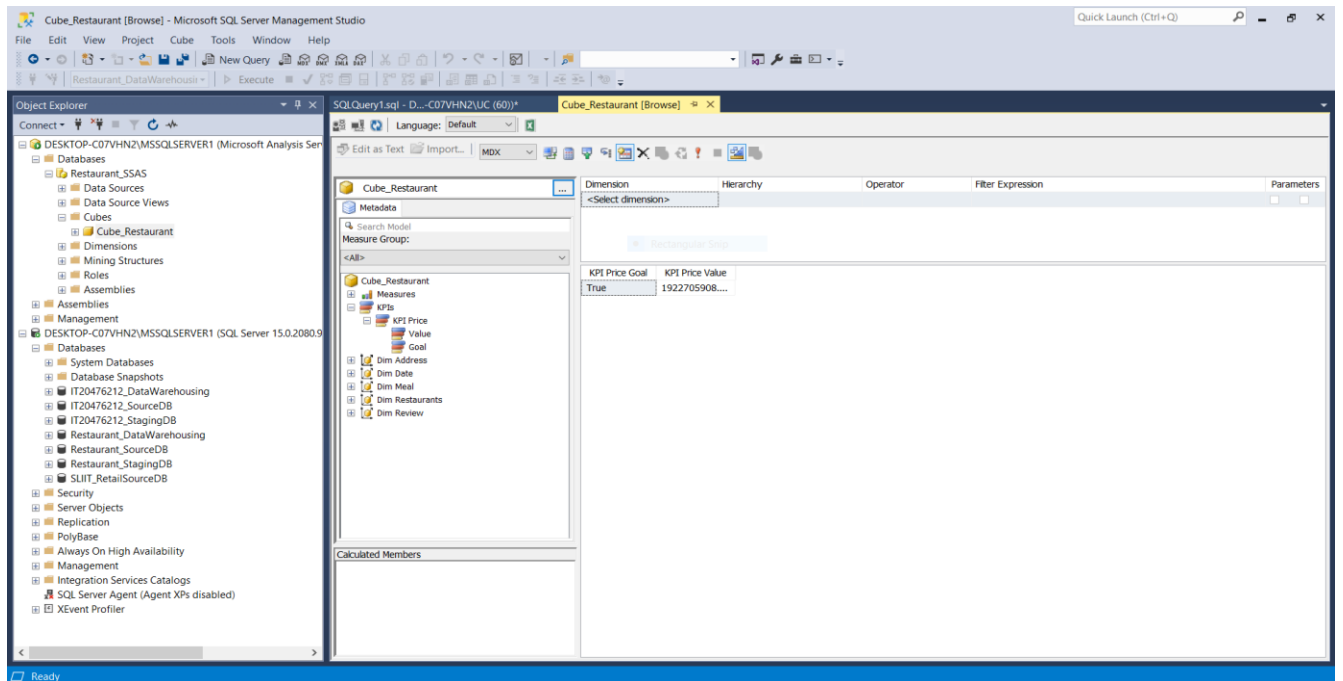

KPI Use for monitoring measures.

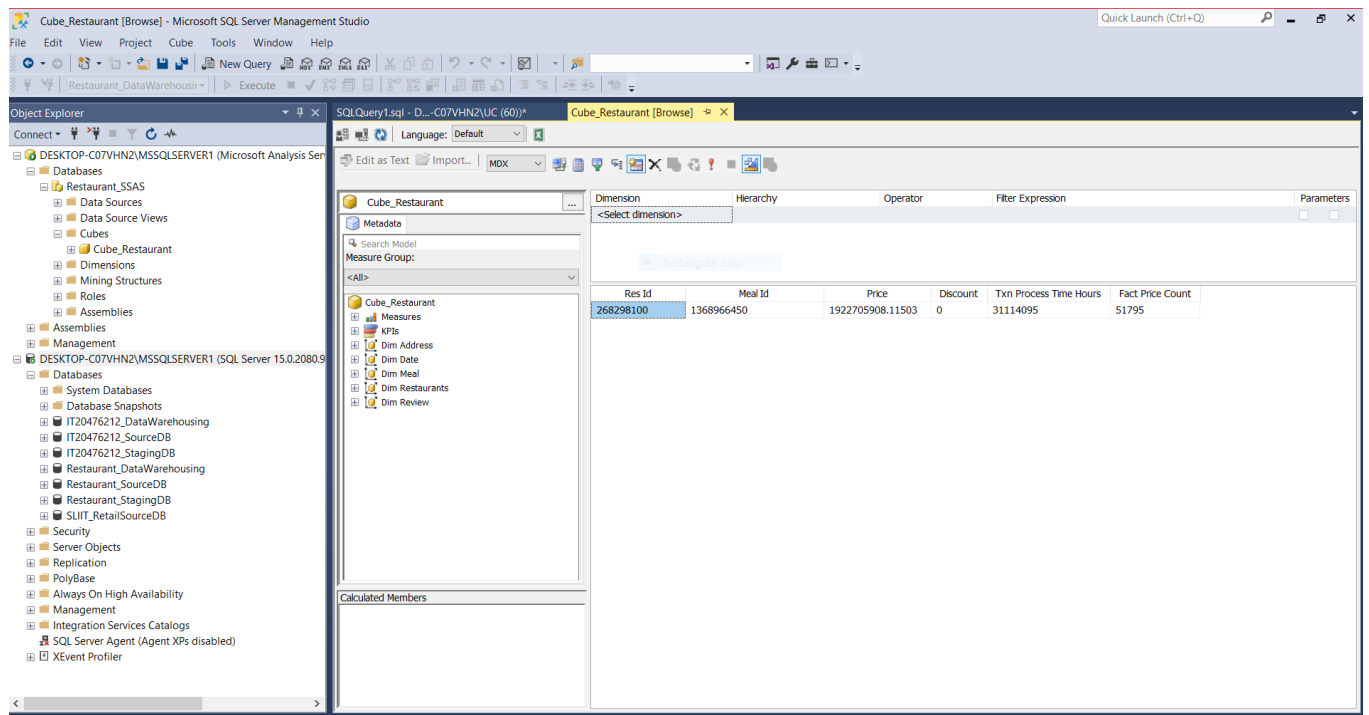

Created KPIs were demonstrated below.

After deploying of this Cube look like this,

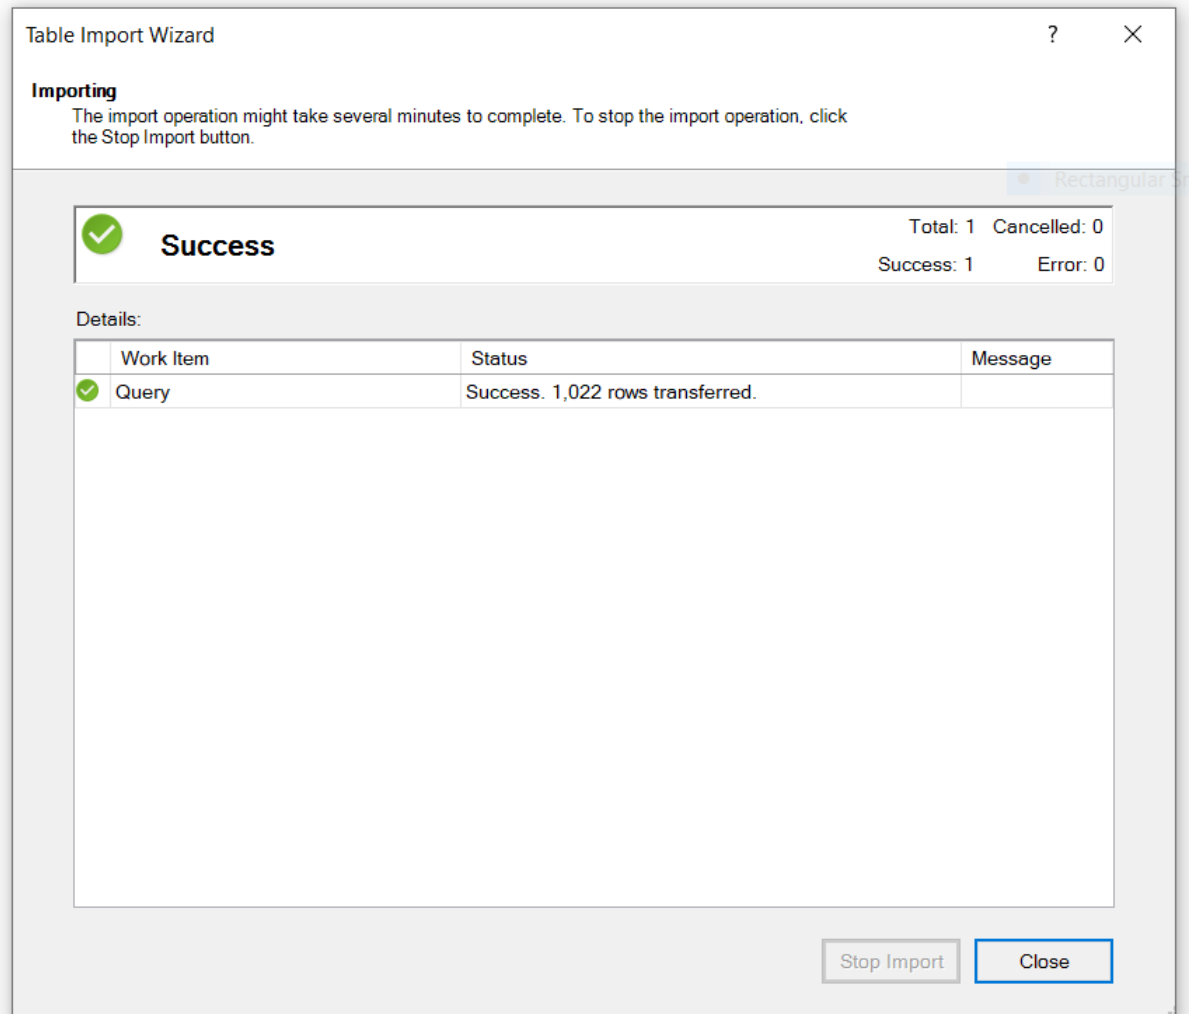

## OLAP Operation

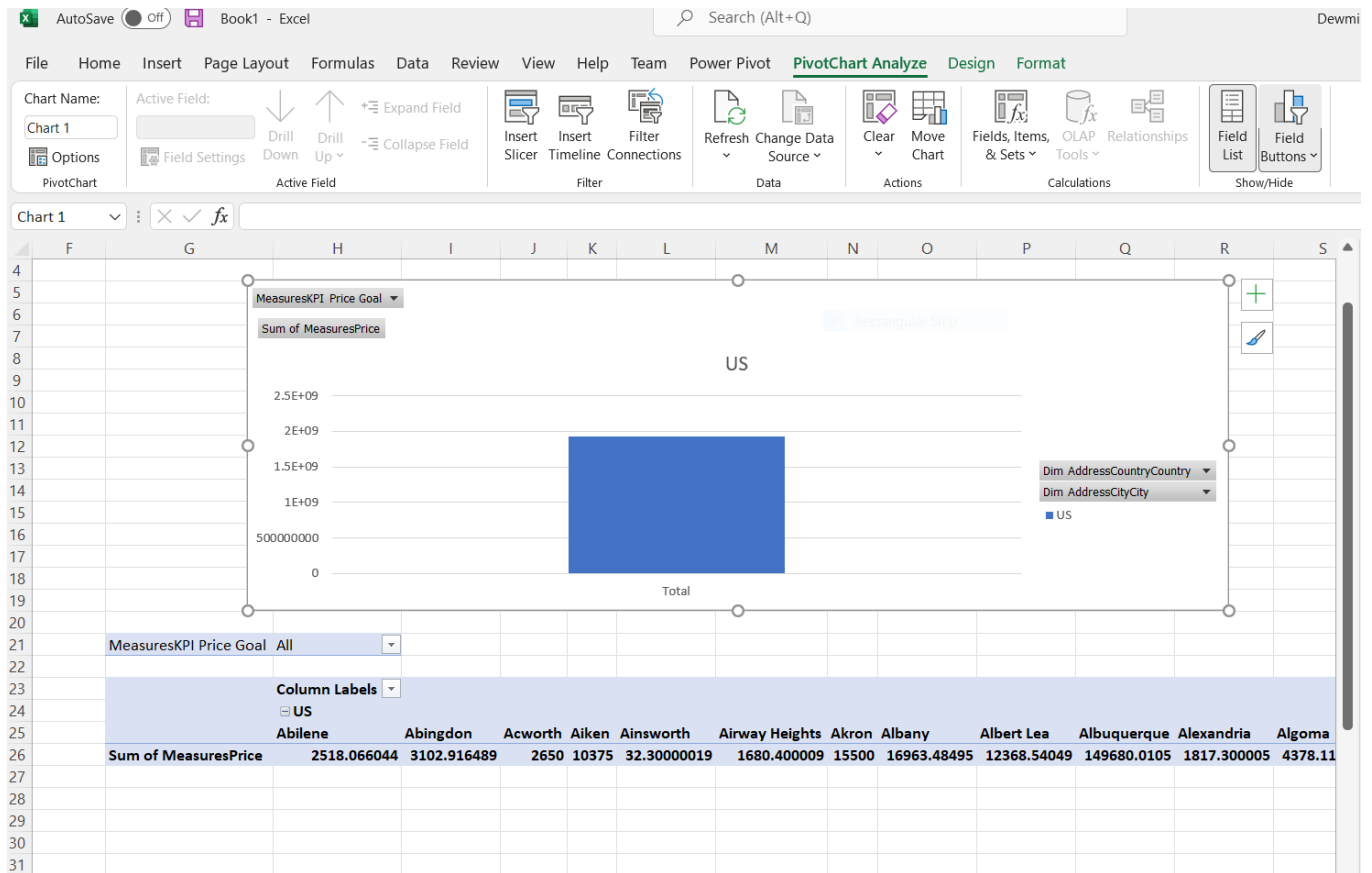

Using Excel 2016 Power Pivot we can do all OLAP operation

The SSAS cube "Restaurant\_SSAS" which was created in the above step was then connected to the Excel using the MDX query.

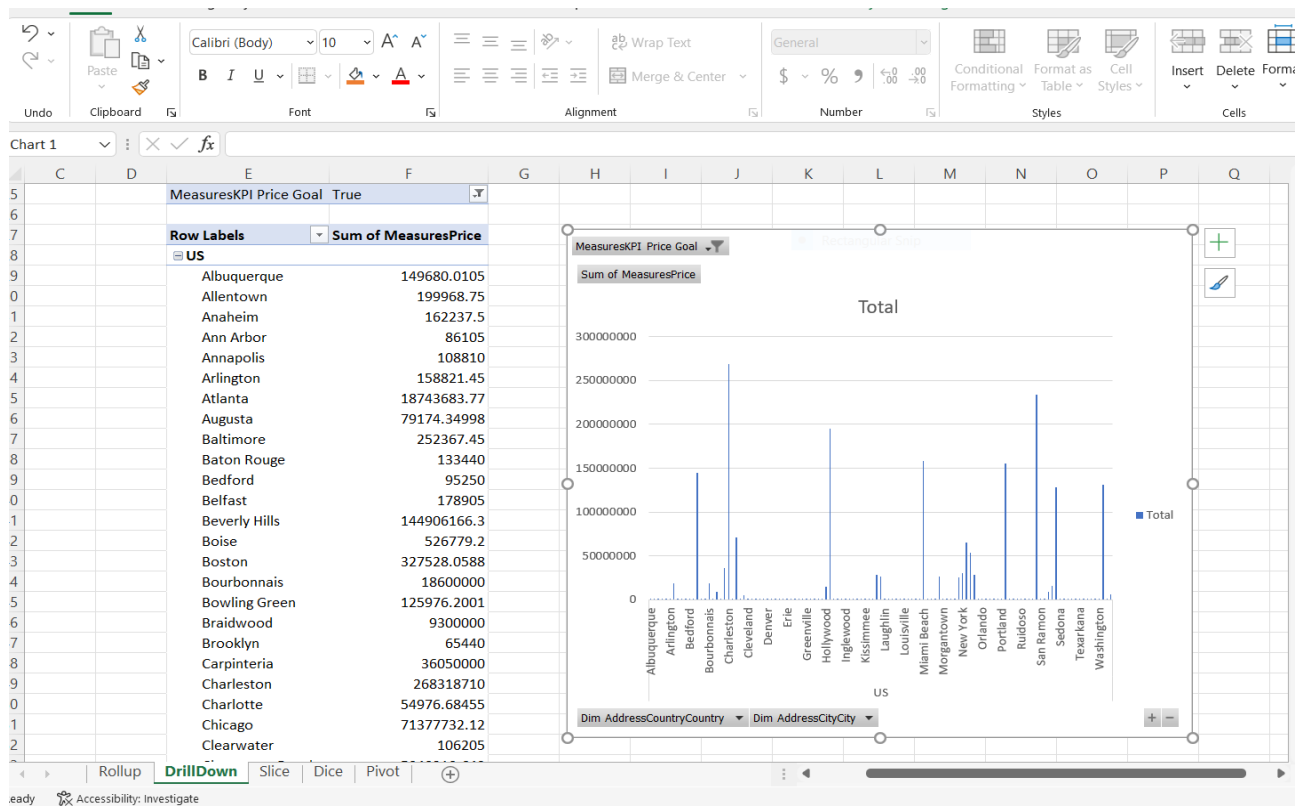

## □ Roll Up

The roll-up operation performs aggregation on a data cube, either by climbing up a hierarchy or by climbing down a hierarchy

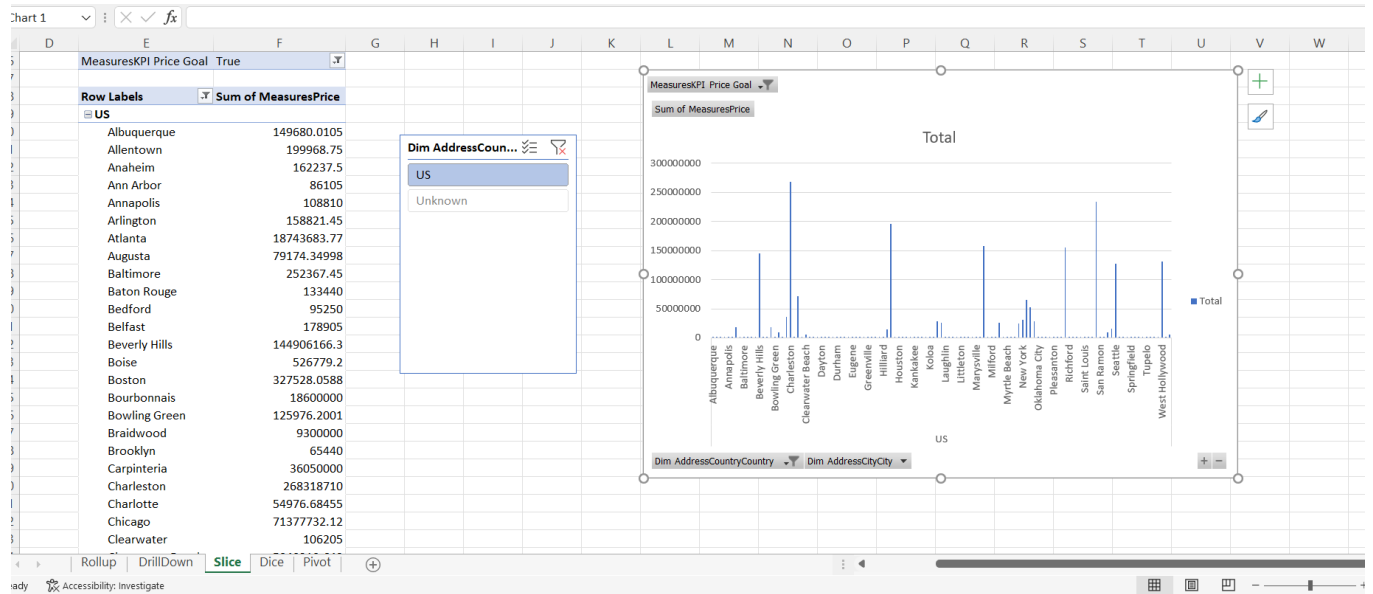

## □ Drill-Down

The Drill down operation is the reverse of roll up. It navigates from less detailed data to more detailed data.

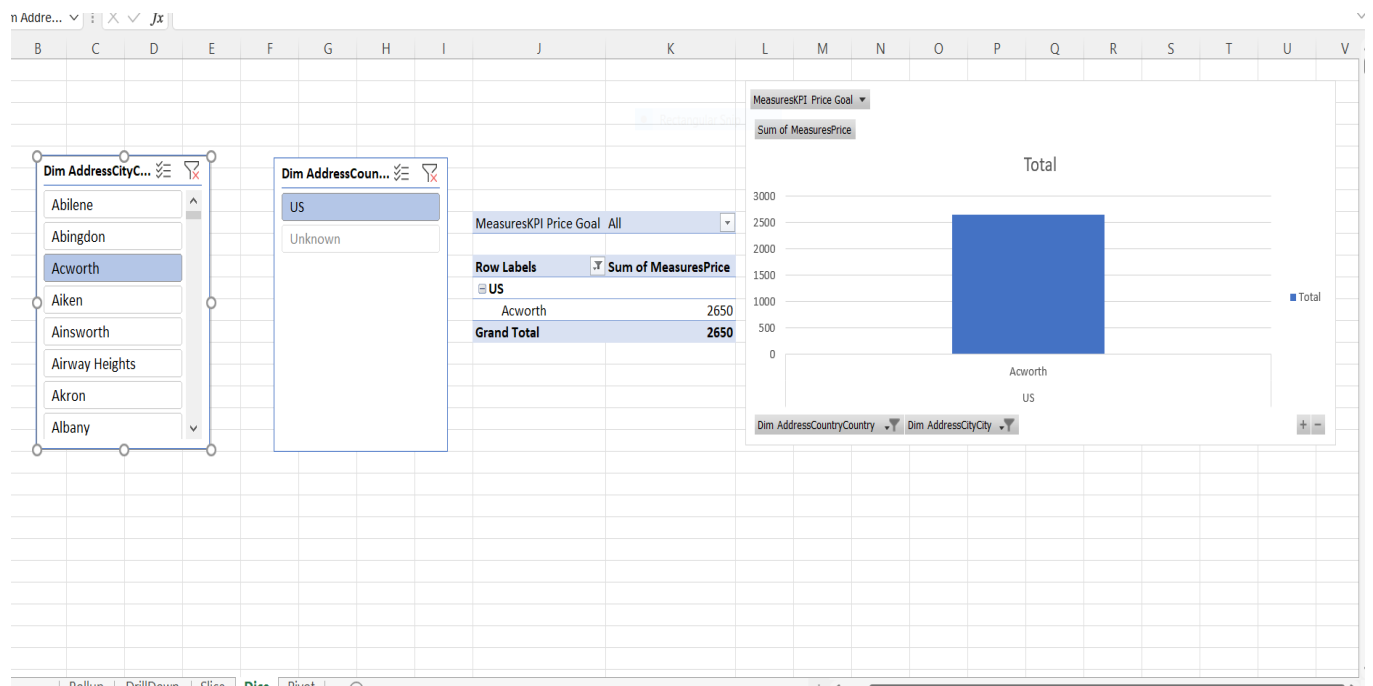

## ❑ Slicing

Slice performs a selection on one dimension of the given cube, thus resulting in a sub cube.

## ❑ Dice

The dice operation defines a sub cube by performing a selection on two or more dimensions.

- Pivot

In pivot the data axes were rotated to provide alternative presentation to data.
